Stores Grid

KatanaPIM for Magento 2

Manage KatanaPIM store mappings in the KatanaPIM Connect Stores grid. Map KatanaPIM stores to Magento store views for category-to-store coupling and multi-store setups.

Accessing the Grid

Navigate to **Katana PIM → Stores** in the admin menu (under Settings).

Grid Columns

Column	Description
ID	Internal entity ID
Katana PIM ID	Store ID from KatanaPIM
Name	Store display name from KatanaPIM
System Name	System/internal name from KatanaPIM
Magento Store View	Mapped Magento store view (inline editable)
Website	The Magento website that the mapped store view belongs to (read-only, derived from the store view mapping)

Importing Stores

Click **Import Stores** in the toolbar to fetch all stores from the KatanaPIM API. This populates the grid with the available KatanaPIM stores.

Mapping Stores to Magento Store Views

The key function of this grid is mapping each KatanaPIM store to a Magento store view. This mapping is used by the category-to-store coupling feature.

Inline Editing

1. Click on any row in the grid
2. Select the correct **Magento Store View** from the dropdown
3. Save

Once set, the mapping is persistent — name changes on either side won't break the coupling.

Fallback Matching

If no direct mapping is set, the module falls back to automatic matching:

1. **Name match** — case-insensitive match on Magento store view name
2. **Code match** — match on Magento store view code

Direct mapping via this grid is recommended for reliability.

Why Store Mapping Matters

Store mappings are used in several features:

Feature	How it uses store mapping
Product website assignment	When Website Assignment Source is set to "Katana Stores", products are assigned to websites based on their Katana store mappings. See Product Website Matching.
Category-to-store coupling	Determines which store views a category is active/inactive on
Tree placement	Resolves which root category tree a top-level category belongs to
Per-store visibility	Sets `is_active` per store view during category sync

Without correct store mappings, categories may be visible on all store views or placed under the wrong root category, and products may be assigned to incorrect websites.
